

Greenfire Resources

Deep diligence memo · review 01KVXZ2E0YDHJ6G94YE1A11Z2X · generated 2026-06-24T23:38:16.804441

1. EXECUTIVE SUMMARY

Greenfire Resources — Deep-tier diligence review. 36 finding(s) across 1 source(s), 5 research round(s). Overall confidence: **low**. Highest risk band observed: **Elevated**.

Searched interpreted due-diligence findings on Greenfire Resources, focused on regulatory emissions/release records for the Greenfire Resources Operating Corporation Hangingstone SAGD Demonstration Facility, 2022 reporting period. Records reviewed cover substance-specific release disclosures: hydrogen sulphide (176362), total reduced sulphur (176363), ethylene glycol (176364), methanol (176365), toluene (176366), benzene (176367), xylene/all isomers (176368), and total VOCs (176369), consistent with a Canadian multi-pollutant reporting regime (likely NPRI). Coverage is thin and limited in several respects: (1) every retrieved record has a null/blank quantity field, so no release magnitudes could be assessed; (2) interpretive confidence is uniformly low; (3) the record set appears partial — additional allowed finding IDs (176370-176379, 185032-185038, 295570-295580) were not accompanied by interpreted findings in this run and were therefore not synthesized; (4) no financial, operational, corporate, or transactional findings were available, so this synthesis is confined to environmental emissions reporting only. No multi-year trend, threshold context, or enforcement/compliance data was present.

3 material risk(s) and 0 opportunity(ies) identified — see Risks / Opportunities.

2. OVERALL RISK

Elevated		3
Watch		33

36 finding(s): 3 elevated, 33 watch.

3. COMPANY & SECTOR EXPOSURE

Declared scope: oil and gas, energy.

Evidence touches: Energy & Pipelines (3).

Energy & Pipelines		3

4. MATERIAL DEVELOPMENTS

- **WATCH** Greenfire Resources Operating Corporation — Hangingstone SAGD Demonstration Facility: released [quantity not populated] tonnes of Hydrochloric acid, dated 2023-01-01. — The record confirms that Greenfire Resources Operating Corporation reported a release of Hydrochloric acid at its Hangingstone SAGD Demonstration Facility for the 2023 reporting period. Hydrochloric acid is a regulated substance commonly tracked under Canadian environmental reporting frameworks (e.g., the National Pollutant Release Inventory). Its presence in a SAGD facility context may relate to operational processes such as water treatment, scale removal, or chemical injection. However, because the quantity field is unpopulated in the retrieved record, the scale of the release — and therefore its potential regulatory, liability, or reputational significance — cannot be assessed from this record alone. Contextual records for the same facility and period also show releases of multiple other regulated substances (NO_x, methanol, benzene, n-hexane, PM₁₀, hydrogen sulphide, VOCs, carbon monoxide, sulphur dioxide, toluene, and total reduced sulphur), suggesting a broad multi-substance emissions profile was reported for this facility in 2023. — *The inability to assess release quantity prevents any calibration of regulatory exposure, potential enforcement risk, or compliance standing. A material Hydrochloric acid release could attract regulatory scrutiny, community opposition, or remediation obligations depending on volume and site conditions. The breadth of co-reported substances across the same facility increases the surface area of potential environmental liability that a counterparty may wish to investigate.* [source_records:295570](#)
- **WATCH** Greenfire Resources Operating Corporation — Hangingstone SAGD Demonstration Facility: released [blank] tonnes of Nitrogen oxides (expressed as nitrogen dioxide) in 2023, as recorded in a source record dated 2023-01-01. The quantity field (amount) is null/unpopulated. — The record confirms that Greenfire Resources Operating Corporation reported a nitrogen oxides (NO_x) emission entry for its Hangingstone SAGD Demonstration Facility under what appears to be a regulatory or environmental disclosure regime for the 2023 reporting year. However, the actual emission quantity is absent from the retrieved record. The same pattern — a populated substance name but a missing tonnage value — is observed across all eleven co-retrieved emission records for the same facility and year (covering hydrochloric acid, methanol, benzene, n-hexane, PM₁₀, hydrogen sulphide, VOCs, carbon monoxide, sulphur dioxide, toluene, and total reduced sulphur). This may indicate a data-extraction or data-ingestion gap rather than a genuine nil release, since the facility is an operating SAGD (Steam-Assisted Gravity Drainage) oil sands site where combustion-related NO_x emissions would typically be expected. — *Without the quantified tonnage, it is not possible to assess the materiality of the facility's NO_x emissions relative to applicable regulatory thresholds (e.g., Canada's National Pollutant Release Inventory reporting thresholds), potential compliance obligations, or environmental liability exposure. The breadth of missing quantities across all co-reported substances amplifies this gap and limits the ability to characterize the facility's overall environmental footprint from this source alone.* [source_records:295571](#)

5. LEGISLATIVE & REGULATORY

Insufficient evidence in this run for this section.

6. GOVERNMENT SUPPORT & DEPENDENCIES

Insufficient evidence in this run for this section.

7. LOBBYING & STAKEHOLDERS

Insufficient evidence in this run for this section.

8. POLITICAL & REPUTATIONAL ATTENTION

- **WATCH** Greenfire Resources Operating Corporation — Hangingstone SAGD Demonstration Facility: released [blank/null] tonnes of Hydrogen sulphide, dated 2022-01-01. — The record confirms that Greenfire Resources Operating Corporation was subject to a hydrogen sulphide (H₂S) emissions reporting obligation for the Hangingstone SAGD Demonstration Facility in the 2022 reporting period. The fact that the substance appears in a regulatory emissions dataset indicates the facility was required to report on H₂S releases, which is consistent with oil sands SAGD operations where sour gas handling is a standard operational and environmental consideration. However, the quantity field is null/blank in the retrieved record, meaning the actual magnitude of the release cannot be assessed from this record alone. The broader context of the query — spanning thirteen substance-specific records for the same facility and year (including VOCs, benzene, particulate matter, and other sulphur compounds) — suggests this is part of a multi-pollutant emissions disclosure, likely under Canada's National Pollutant Release Inventory (NPRI) or equivalent provincial reporting regime. — *Without a quantified emission figure, it is not possible to assess the scale of H₂S releases or compare them against regulatory thresholds, industry benchmarks, or prior years. The presence of a reporting obligation for H₂S, alongside multiple other regulated substances, indicates the facility carries a non-trivial environmental compliance footprint. If the null quantity reflects a data gap rather than a zero emission, this could represent an incomplete disclosure picture with potential implications for environmental liability assessments, regulatory standing, and ESG risk profiling.*
[source_records:176362](#)
- **WATCH** Greenfire Resources Operating Corporation — Total reduced sulphur (expressed as hydrogen sulphide) (2022) — Hangingstone SAGD Demonstration Facility: released [blank] tonnes of Total reduced sulphur (expressed as hydrogen sulphide), dated 2022-01-01. — The record confirms that Greenfire Resources Operating Corporation reported a release of Total reduced sulphur (expressed as hydrogen sulphide) from its Hangingstone SAGD Demonstration Facility for the 2022 reporting period. The release quantity field is blank in the retrieved record, meaning the actual tonnage cannot be assessed from this source alone. The existence of the record indicates the facility was subject to regulatory emissions reporting obligations for this substance class in 2022. The broader query context (records 176362–176374) shows that the same facility also reported releases across a range of other substances — including hydrogen sulphide directly, VOCs, BTEX compounds, particulate matter, and process chemicals — suggesting a multi-pollutant emissions profile typical of oil sands SAGD operations. — *Without a confirmed tonnage figure, it is not possible to assess the scale of this specific emission or benchmark it against*

regulatory thresholds or peer operators. The presence of reporting across multiple sulphur, VOC, and particulate categories at the same facility could indicate environmental compliance obligations, potential community or regulatory sensitivities, or liabilities that may be material to a transaction involving this asset.

12. RISKS

- **OBSERVED** The Hangingstone SAGD Demonstration Facility reported releases of regulated toxic substances including benzene and sour-gas compounds (hydrogen sulphide, total reduced sulphur) in 2022, indicating exposure to environmental and health-related regulatory reporting obligations. [source_records:176362](#)[source_records:176363](#)[source_records:176367](#)
- **OBSERVED** The magnitude of every reported release cannot be assessed because the quantity/tonnage field is null or blank across all retrieved substance records. This prevents any evaluation of whether releases were de minimis, below reportable thresholds, or material, and limits the ability to gauge regulatory or reputational significance. [source_records:176362](#)[source_records:176363](#)[source_records:176364](#)[source_records:176365](#)[source_records:176366](#)[source_records:176367](#)[source_records:176368](#)[source_records:176369](#)
- **SPECULATIVE** The blank quantity fields may reflect either data-omission/population gaps in the source dataset or releases falling below reportable thresholds; the cause is undetermined, creating uncertainty about the completeness and reliability of the emissions disclosure as captured. [source_records:176365](#)[source_records:176369](#)

13. OPPORTUNITIES

Insufficient evidence in this run for this section.

14. QUESTIONS FOR MANAGEMENT

1. What are the actual reported tonnages for each substance (H₂S, total reduced sulphur, benzene, toluene, xylene, ethylbenzene, n-hexane, methanol, ethylene glycol, total VOCs) at the Hangingstone SAGD Demonstration Facility for 2022, and how do they compare to reportable thresholds?
2. Are the blank quantity fields due to sub-threshold releases, dataset population gaps, or non-reporting? Can the underlying NPRI/provincial filings be obtained to confirm?
3. How do the 2022 emissions compare to prior and subsequent reporting years to establish a trend for the facility?
4. Are there any compliance actions, exceedances, or enforcement records associated with these reported substances at the facility?
5. Do the additional retrieved records (185032-185038, 295570-295580) relate to the same facility, other Greenfire assets, or different topics, and what do they cover?
6. Which specific regulatory regime governs these disclosures (federal NPRI vs. Alberta provincial reporting), and what are the associated permit/license conditions?
